BOARD OF NAILS TEST

WITH ULTRASEAL COMMERCIAL/INDUSTRIAL GRADE

AND ARMAGUARD' ASSISTANCE

The following test involved an ARMAGUARD Ford F-350 armoured car with 7.50 x 16 8 ply tyres containing tubes.

The board contained 12 only 3" x one-eighth nails hammered through the plank.

Tyre pressure was 50 psi before the test, checked after the Ultraseal Commercial/Industrial grade sealant was installed. The vehicle was then driven for approximately 5 km to distribute the product inside the tube. 28 ounces of sealant were applied.

TEST "C" TUBED F-350 NAIL & BED OF NAILS

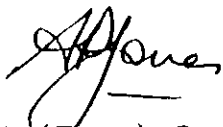

The vehicle was inched forward over the board of nails, and no air was heard to escape.

The nails were straightened and the vehicle reversed over the board of nails again. Particular attention was taken to listen for any air escaping - none was heard.

The vehicle was then driven about one kilometre to ensure proper sealing, and the pressure was then re-checked at 50 psi.

Next morning, the tyre pressure was still OK after 24 holes had been made the previous afternoon. The vehicle was then driven another 35 km and some three hours later, the holed tyre was still inflated.

We are indebted to Mr. Peter Forbes, ARMAGUARD's National Fleet Manager, Mr. Brian Scott, Armourer and the very helpful staff of ARMAGUARD for their advice, providing the target range, firearms and ammunition, and also for providing the wheels and tyres.
